RESEARCH UNDERWAY

Due to the shutdown following the COVID pandemic the recent research has been more focused on developing simple yet effective predictive models for thermodynamic and transport properties to give good agreement with the experimental findings with the focus on Ionic Liquids [*J Chem Thermodyn*, 156, 106383 [2021], *J. Mol. Liq.*, 367,120457(2022)] as one of the components, since mixtures with ionic liquids as one of the components are very difficult to model owing to their non-ideal behavior. Machine Learning is also being tested.

- For the first time, a volume fraction based approach(DEY-BISWAS) was developed for predicting viscosity of binary and multicomponent liquid mixtures and was published in *Journal of Molecular Liquids*, 265, 356-360 (2018).

DEY-BISWAS has been tested on more than **600 binary**, more than 50 ternary and 5&6 component mixtures over a wide range of temperature with very good agreement with experimental findings. It has also been tested on IL mixtures and Deep Eutectic solvents with at varying temperature with a fair degree of accuracy, *Journal of Molecular Liquids*, 367 120457 (2022).

- A modified form of the Hind Ubbelohde approach has been tested on 150 + binary, ternary and quaternary liquid mixtures, *Journal of Molecular Liquids* 333 (2021) 115919.
- A Volume fraction based Hind-Ubbelohde modification has been tested on 196 binary, 13 ternary and 5 quaternary mixtures at varying temperatures (*Journal of Molecular Liquids* 350 (2022) 118526).
- A New pathway developed for predicting viscosity of binary and multicomponent liquid mixtures was presented at **THERMAM 2017 at University of Rostock, Rostock, Germany, 17th - 18th July, 2017.**
- Modified Frenkel approach has been tested on a number of binary and ternary liquid mixtures (*RSC Advances*, 6,43838-43,2016).
- Two new simple models developed for predicting viscosity of binary, ternary and higher order liquid mixtures (*RSC Advances* ,6, 113657–113662, 2016).
- For the first time, with my collaborator, Dr. Mihaiela C. Stuparu, of Nanyang Technical University (NTU) Singapore, we have investigated **Host-guest interaction between corannulene and γ -cyclodextrin: Mass spectrometric evidence of a 1:1 inclusion complex formation**, [*RSC Advances Communications*, 6,110001-110003(2016)].
- Transport properties like viscosity (*J. Mol. Liq.*,211,686-694,2015), thermal conductivity and surface tension of binary and multicomponent liquid mixtures have also been evaluated using various approaches (*J. Mol. Liq.*, 273,165-173,2016).

- Evaluation of various excess properties like excess volume (*J. Mol. Liq., Vol 211,2015*), excess enthalpy (*J. Mol. Liq: 195,2014*) and excess energy is also being carried out.

Theoretical knowledge of thermodynamic, transport, interfacial properties of multicomponent liquid mixtures is essential for studying intermolecular interactions used extensively in applications and engineering design processes associated with various industries.

The aim is to develop simple, effective and universal equations for predicting thermodynamic, transport, optical and allied properties which will give Average Absolute Percentage Deviations than the currently existing ones. The second aim is to develop new technologies which will help in Water Energy Nexus (WEN) applications.
